

Technical Planning and Documentation

Transition from Business-Oriented Planning to Technical Preparation

Objective: Develop a high-level technical plan, including system architecture, workflows, and API requirements, to serve as a blueprint for implementation.

Technical Preparation

High-Level Technical Plan

1. System Architecture

- **Frontend:**
 - Technology: React.js (or Next.js for SSR and scalability).
 - Features:
 - User-friendly interface.
 - Mobile-first, responsive design.
 - Accessible navigation for categories, search, and cart.
- **Backend:**
 - Technology: Node.js with Express.js (or an equivalent framework).
 - Features:
 - RESTful APIs for core functionality.
 - Authentication and authorization.
 - Integration with Sanity for CMS (content management).
- **Database:**
 - Technology: MongoDB for NoSQL or PostgreSQL for relational data.
 - Features:
 - Schema to store products, orders, and customers.

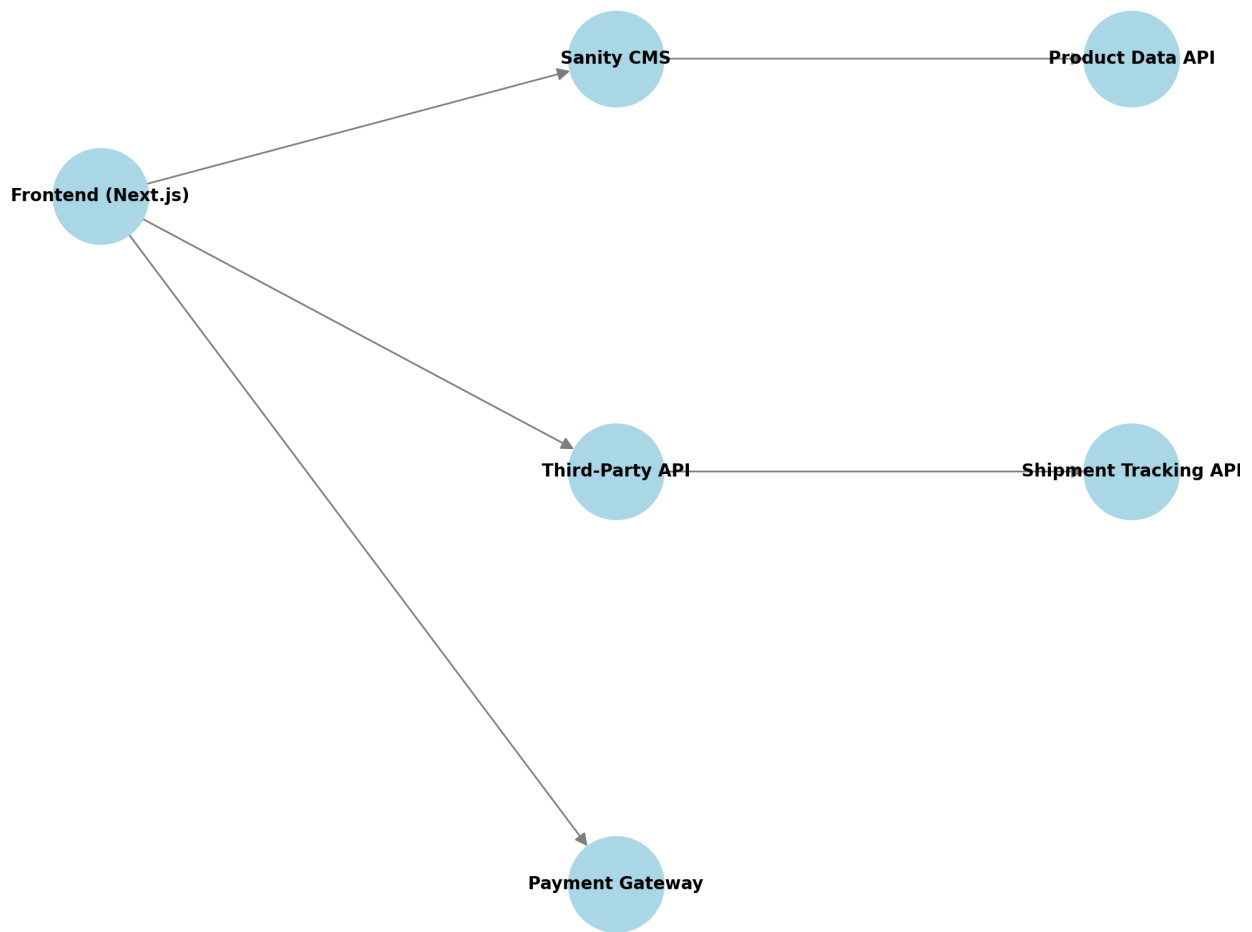

2. Workflows

- **User Registration & Login**
 - Steps:
 1. User submits details.
 2. Backend validates and stores data.
 3. JWT token generated for session management.
- **Product Browsing & Search**

- Steps:
 1. User queries products.
 2. Backend fetches relevant results.
 3. Results displayed dynamically.
- **Order Placement**
 - Steps:
 1. User adds items to the cart.
 2. Order details validated and saved.
 3. Notification or confirmation sent.

2. API Requirements

- **Authentication**
 - POST /api/register - Register a new user.
 - POST /api/login - Authenticate user.
- **Products**
 - GET /api/products - Retrieve product listings.
 - GET /api/products/:id - Fetch single product details.
 - POST /api/products - Add a new product (admin only).
- **Orders**
 - POST /api/orders - Place an order.
 - GET /api/orders/:id - Retrieve order details.
 - GET /api/orders - List all orders (admin only).

Frontend Requirements

1. **User-friendly Interface:**
 - **Tools:** Use **Next.js** for SSR and client-side routing for dynamic product pages.
 - **Design:** Use reusable components for cards, headers, footers, etc., styled with CSS modules or styled-components for a clean UI.
 - **UX Enhancements:** Include features like search, filters, and pagination for easy browsing.
2. **Responsive Design:**
 - Use media queries or responsive libraries like **CSS Grid** and **Flexbox**.
 - Test on multiple devices using browser developer tools or simulators.

3. **Essential Pages:**

- **Home:** Highlight featured products or promotions.
 - **Product Listing:** Grid view with search, filter, and sorting functionalities.
 - **Product Details:** Show images, specifications, price, and availability.
 - **Cart:** Allow users to view, edit, or remove items.
 - **Checkout:** Capture delivery address and payment information.
 - **Order Confirmation:** Display order summary and tracking details.
-

Sanity CMS as Backend

1. **Setup:**

- Install and configure Sanity CMS.
- Connect it with the Next.js frontend using **Sanity Client**.

2. **Schema Design:**

- **Products:** Name, description, price, category, stock, and images.
- **Customers:** Name, email, address, and order history.
- **Orders:** Customer details, products ordered, total price, and status.

3. **Scalability:**

- Use Sanity's GROQ queries to fetch data efficiently.
 - Consider caching frequent requests using Next.js API routes.
-

Third-Party APIs

1. **Shipment Tracking:**

- Integrate a tracking API like **AfterShip** or **Shippo**.
- Provide a tracking number with real-time updates on the order confirmation page.

2. **Payment Gateway:**

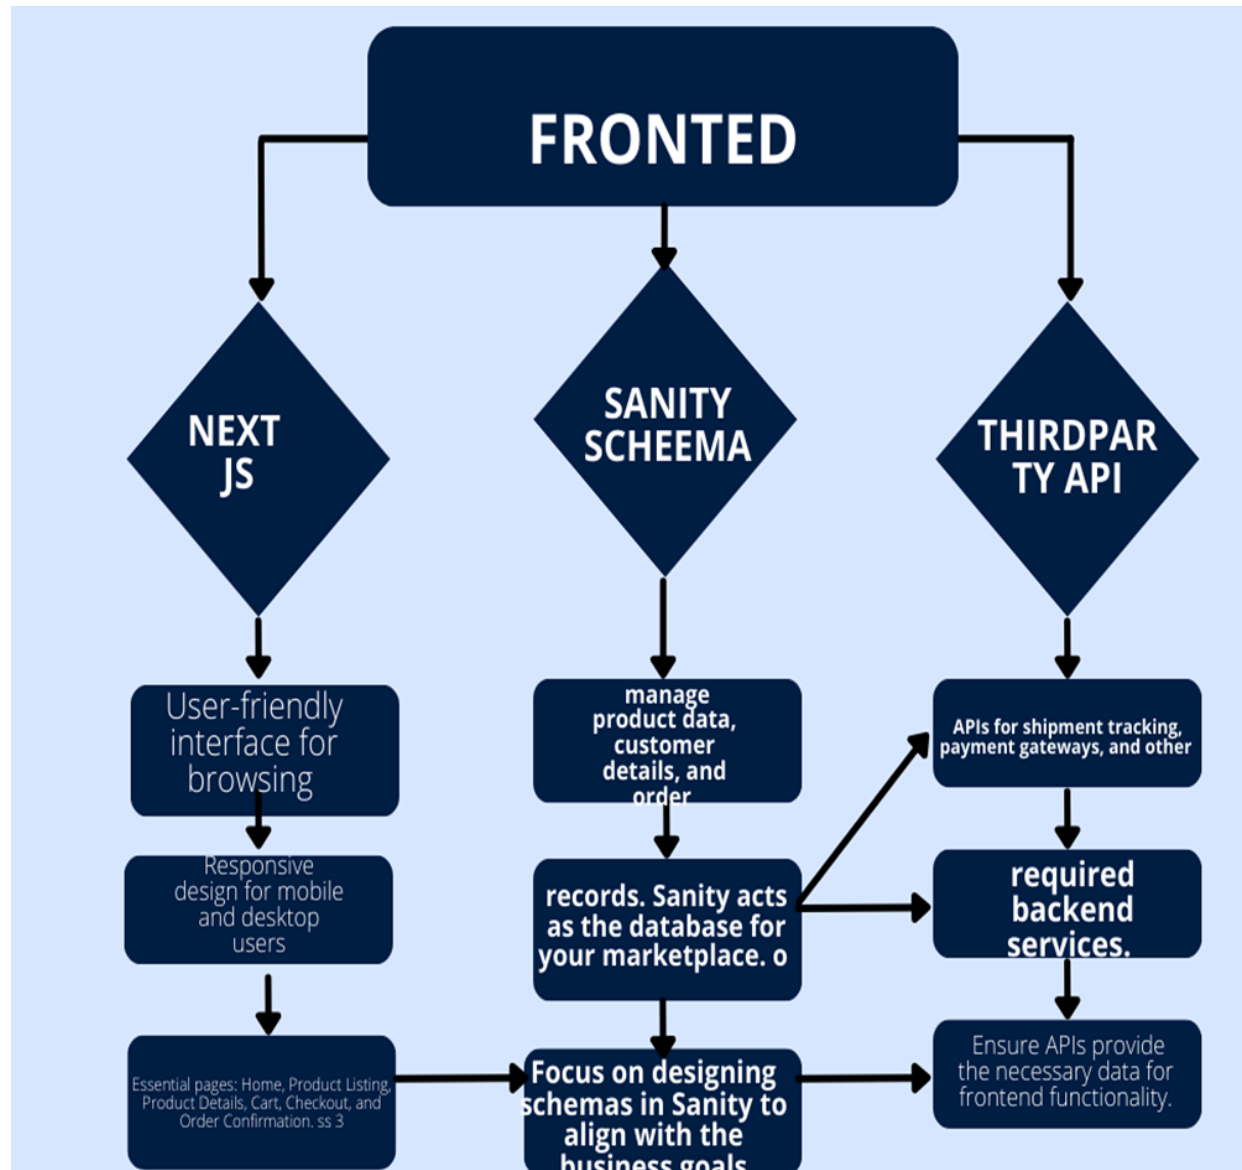

- Use popular APIs like **Stripe** or **PayPal**.
- Securely handle payment tokens and process transactions.

3. **Backend Services:**

- Use services like **Twilio** for SMS notifications or **SendGrid** for email receipts.

API Endpoints

Endpoint	Method	Purpose	Response Example
/products	GET	Fetches all product details	{ "id": 1, "name": "Product A", "price": 100 }
/product/:id	GET	Fetches details of a single product	{ "id": 1, "name": "Product A", "price": 100, "stock": 20 }
/register	POST	Registers a new user	{ "success": true, "message": "User registered" }

System Architecture Design

High-Level Diagram:

[Frontend (Next.js)]

|

Typical Data Flow

1. **Product Browsing:**
 - User interacts with the frontend.
 - Next.js fetches product data from Sanity using its API.
 2. **Cart Management:**
 - Cart state is managed on the client-side (localStorage/Redux).
 3. **Checkout:**
 - Frontend sends the order details to Sanity and triggers a payment API request.
 4. **Order Confirmation:**
 - Upon successful payment, Sanity stores order details.
 - Shipment tracking data is fetched from the third-party API.
-

Next Steps

1. **Setup Development Environment:**
 - Install Next.js and configure Sanity.
 - Create a repository for version control.
2. **Start with Backend Schemas:**
 - Design and test schemas in Sanity to ensure alignment with business goals.
3. **Frontend Components:**
 - Build reusable components for scalability.
4. **API Integration:**
 - Configure APIs for shipping and payment.

5. **Testing:**

- Conduct unit tests, integration tests, and user testing to ensure robustness.

Frontend Requirements

1. **User-friendly Interface:**

- **Tools:** Use **Next.js** for SSR and client-side routing for dynamic product pages.
- **Design:** Use reusable components for cards, headers, footers, etc., styled with CSS modules or styled-components for a clean UI.
- **UX Enhancements:** Include features like search, filters, and pagination for easy browsing.

2. **Responsive Design:**

- Use media queries or responsive libraries like **CSS Grid** and **Flexbox**.
- Test on multiple devices using browser developer tools or simulators.

3. **Essential Pages:**

- **Home:** Highlight featured products or promotions.
- **Product Listing:** Grid view with search, filter, and sorting functionalities.
- **Product Details:** Show images, specifications, price, and availability.
- **Cart:** Allow users to view, edit, or remove items.
- **Checkout:** Capture delivery address and payment information.
- **Order Confirmation:** Display order summary and tracking details.

Sanity CMS as Backend

1. **Setup:**

- Install and configure Sanity CMS.
- Connect it with the Next.js frontend using **Sanity Client**.

2. **Schema Design:**

- **Products:** Name, description, price, category, stock, and images.
- **Customers:** Name, email, address, and order history.
- **Orders:** Customer details, products ordered, total price, and status.

3. **Scalability:**

- Use Sanity's GROQ queries to fetch data efficiently.

- Consider caching frequent requests using Next.js API routes.

Third-Party APIs

1. **Shipment Tracking:**

Example System Architecture: [Frontend (Next.js)] | | | [Sanity CMS] [3rd Party APIs] Key Workflows to Include: 1. User Registration: ○ User signs up -> Data is stored in Sanity -> Confirmation sent to the user. 2. Product Browsing: ○ User views product categories -> Sanity API fetches data -> Products displayed on frontend. 3. Order Placement: ○ User adds items to the cart -> Proceeds to checkout -> Order details saved in Sanity. 4. Shipment Tracking: ○ Order status updates fetched via 3rd-party API -> Displayed to the user. 3. Plan API Requirements

Based on your data schema, define the API endpoints needed. Include: · Q-Commerce
Example: o Endpoint Name: /express-delivery-status o Method: GET

[Sanity CMS] [3rd Party APIs]

Key Workflows

1. User Registration:

o Flow:

- User fills out a registration form on the frontend.
- Data (name, email, password) is sent to the backend and stored in Sanity.
- A confirmation email is triggered using a third-party service (e.g., SendGrid).

o APIs Used:

- Sanity CMS for data storage.
- Email service API for confirmations.

2. Product Browsing:

o Flow:

- User navigates to the product categories.
- Sanity API fetches products based on the selected category using GROQ queries.
- Data is displayed dynamically on the frontend.

o APIs Used:

- Sanity API for fetching product data.

3. Order Placement:

o Flow:

- User adds items to the cart (client-side state management using Redux or Context API).
- User proceeds to checkout and fills out details.
- Order details are sent to Sanity and stored in an "Orders" schema.

o APIs Used:

- Sanity API for storing order details.
- Payment gateway API for processing payments.

4. Shipment Tracking:

- **Flow:**
 - Shipment status updates are fetched from a third-party shipment tracking API.
 - Updates are displayed to the user in the "Order Details" section.
- **APIs Used:**
 - Shipment tracking API (e.g., AfterShip or Shippo).

Plan API Requirements

1. User Registration

- **Endpoint Name:** `/register`
- **Method:** POST
- **Payload:** `{ "name": "John Doe", "email": "john@example.com", "password": "securePassword123" }`
- **Response:** `{ "success": true, "message": "User registered successfully" }`

2. Fetch Products

- **Endpoint Name:** `/products`
- **Method:** GET
- **Query Parameters:** `category, priceRange, search`
- **Response:**

json

CopyEdit

```
[
  {
    "id": "12345",
    "name": "Product Name",
    "price": 50.0,
    "category": "Electronics",
    "image": "url_to_image"
  }
]
```

3. Place Order

- **Endpoint Name:** `/order`
- **Method:** POST
- **Payload:**

```
json
CopyEdit
{
  "customerId": "98765",
  "items": [
    { "productId": "12345", "quantity": 2 },
    { "productId": "67890", "quantity": 1 }
  ],
  "totalPrice": 150.0,
  "shippingAddress": {
    "street": "123 Main St",
    "city": "Los Angeles",
    "state": "CA",
    "zip": "90001"
  },
  "paymentToken": "payment_token_from_gateway"
}
```

- **Response:** `{ "orderId": "54321", "status": "Order Placed" }`

4. Shipment Tracking

- **Endpoint Name:** `/shipment-status`
- **Method:** GET
- **Query Parameters:** `orderId`
- **Response:**

```
json
CopyEdit
{
  "orderId": "54321",
  "status": "In Transit",
  "estimatedDelivery": "2025-01-20"
}
```

5. Express Delivery Status (Q-Commerce Example)

- **Endpoint Name:** `/express-delivery-status`
- **Method:** GET
- **Query Parameters:** `orderId`
- **Response:**

json

CopyEdit

```
{
  "orderId": "54321",
  "deliveryStatus": "Arriving Soon",
  "riderDetails": {
    "name": "Jane Doe",
    "contact": "+123456789",
    "location": { "lat": 34.052235, "lng": -118.243683 }
  }
}
```

Next Steps

1. Finalize **Sanity Schemas** for users, products, and orders.
2. Define reusable **API functions** in Next.js for backend communication.
3. Configure and test integrations for shipment tracking and payment gateways.
4. Build UI components to consume these APIs.
